ACTIVITY

Implementing a User Authentication System

The development team is building a user authentication system for a web application. The system allows users to register, log in, and reset their passwords securely.

The backend was developed using Node.js and Express. User data is stored in a PostgreSQL database. Passwords are encrypted using the bcrypt library to improve security.

The API provides three main endpoints: `/register`, `/login`, and `/reset-password`. All endpoints use JSON format for requests and responses.

During testing, the team identified a performance issue related to database queries. After optimizing the indexes, the average response time decreased from 450ms to 180ms.

The system will be deployed on a cloud server using Docker containers. Continuous Integration (CI) is configured to run automated tests before deployment.

1 – Qual a idéia principal do texto ?

2 - Match the terms to their definitions:

- A. Endpoint
- B. Encryption
- C. Database
- D. Deployment
- E. Continuous Integration

- () The process of releasing software to production
- () A URL where an API receives requests
- () Protecting data by converting it into secure format
- () A system to store structured data
- () Automatic testing before merging or deploying code
